

## TPMS: ALCAR SENSOR now ready for multiprogramming

- **Simultaneous programming of four sensors**
- **Multiprogramming works even inside the packaging**
- **Multiprogramming of four sensors takes roughly 15-20 seconds**

ALCAR is simplifying everyday workshop routines even further by offering multiprogramming for the Universal sensors. Especially in the upcoming intense period of fitting winter tyres, time is of the essence in all motor vehicle workshops. The simultaneous programming of four sensors not only speeds up the process but makes it smoother and, above all, safer. Sven Müller, Sales Director TPMS, explains: *“ALCAR is now offering the new multiprogramming feature to its customers, which gives workshops and particularly tyre retail shops a great opportunity to make their routines even more efficient. Up until now, every sensor had to be programmed individually using a hand-held tool. That takes time and can be prone to errors, especially during the peak season. With multiprogramming, that’s a thing of the past.”*

### Simple and fast programming

The TPMS tool is placed together with four **ALCAR Universal sensor** units directly on the packaging. After choosing the car model, the “multiprogramming” menu item is selected and confirmed. Subsequently, all four sensors are programmed simultaneously and then inspected to avoid programming errors. The ALCAR TECH600 automatically compiles an inspection report on the status of the sensors which, in a highly user-friendly approach, is then shown in the display. The new “multiprogramming” feature is free of cost for ALCAR customers.

### ALCAR TECH600 TPMS tool update required

The multiprogramming feature is supported by all ALCAR Universal SENSORS that were manufactured after July 2021. For all ALCAR Plug&Drive SENSORS this function will become available as of February 2022. All sensors that support this function are labelled **“Ready 4 Multiprogramming”** directly on the packaging. The multiprogramming feature will become fully functional once the **ALCAR TECH600 TPMS tool update 3.1** is performed **from mid-September 2021 onwards**. The most recent ALCAR sensor warehouse stock with no labelling on the packaging does not support this feature as of yet. *“We’re gradually increasing the number of Universal sensors that come with the multiprogramming option to support all ALCAR partners in the winter season to the best of our abilities”*, concludes Sven Müller.

### ALCAR online TPMS configurator

In the webshop, ALCAR offers its customers updated daily sensor assignments and the new [TPMS configurator](#). All information is readily available, and important details on cars or OE sensors are displayed neatly. Furthermore, customers receive information on service kits, spare valves and vehicle-related relearn procedures.
